Over time, mathematicians formalized these concepts, leading to the rigorous foundations of analysis in the 19th century?primarily through the work of Augustin-Louis Cauchy, Karl Weierstrass, and others.

Core Objectives of Analysis

- To understand the properties of functions and sequences
- To rigorously define limits, continuity, derivatives, and integrals
- To analyze the behavior of mathematical systems under various operations
- To provide tools for solving real-world problems involving change and accumulation

Branches of Analysis

Analysis is a broad field with several interconnected branches, each focusing on different aspects of mathematical concepts.

Real Analysis

Real analysis deals with real numbers and real-valued functions. It explores the properties of sequences, series, limits, continuity, differentiation, and integration in the context of real numbers.

Complex Analysis

Complex analysis studies functions of complex variables. It involves the analysis of holomorphic functions, complex integration, and conformal mappings, with applications in physics and engineering.

Formally, a function f is continuous at a point c if $\lim_{x \rightarrow c} f(x) = f(c)$.

Differentiation

Differentiation measures how a function changes at a point. The derivative $f'(x)$ indicates the slope of the tangent line to the graph of f .

Integration

Integration accumulates quantities such as area under a curve. The definite integral $\int_a^b f(x) dx$ computes the accumulation of f from a to b .

Sequences and Series

- Sequences: Ordered lists of numbers that approach a limit.
- Series: Sum of the terms of a sequence. Convergence or divergence of series is a central topic in analysis.

Key Theorems and Principles

Several fundamental theorems form the backbone of analysis, providing tools for understanding and

solving problems.

Limit Theorems

- Squeeze Theorem: If $f(x) \leq g(x) \leq h(x)$ near a point and $\lim_{x \rightarrow c} f(x) = \lim_{x \rightarrow c} h(x) = L$, then $\lim_{x \rightarrow c} g(x) = L$.

Continuity Theorems

- Intermediate Value Theorem: If f is continuous on $[a, b]$ and d is between $f(a)$ and $f(b)$, then there exists $c \in [a, b]$ such that $f(c) = d$.

Differentiation and Integration Theorems

- Mean Value Theorem: There exists some $c \in (a, b)$ such that $f'(c) = \frac{f(b) - f(a)}{b - a}$.
